Asphalt pavement conserves aggregate and binders. It is also conserving energy. So we can say that asphalt at the end of its life can be rehabilitated and reused.

Asphalt pavement can be used by recycling it. Thus, there are many methods of asphalt recycling.

- Hot or cold recycling
- Full-depth recycling (FDR)

These methods consist of reprocessing old asphalt into new paving material. This process includes milling or breaking up existing asphalt, combining it with additives, and rejuvenating it.
